AGGREGATION.

FISUBUNIT: HEXAMER CONTAINING 2 SETS OF 3 NONIDENTICAL CHAINS (ALPHA, BETA, & GAMMA), LINKED TO EACH OTHER BY DISULFIDE BONDS.

(ALPHA, BETA, & GAMMA), LINKED TO EACH OTHER BY DISULFIDE BONDS.

FISUBLE FOR SETSION OF FIBRINGEN TO FIBRIN IS TRIGGERED BY THROMBIN, WHICH CLEAVES FILBRINOPEPTIDES A AND B FROM ALPHA & BETA CHAINS, AND THUS EXPOSES THE N-TERMINAL POLYMERIZATION SITES RESPONSIBLE FOR THE FORMATION OF THE SOFT CLOT. THE SOFT CLOT IS CONVERTED INTO THE HARD CLOT BY FACTOR XILLA WHICH CATALYZES THE EPSILON-(GAMMA-GLUTAMYL)LYSINE CROSS-LINKING BETWEEN GAMMA CHAINS (CHENKE) AND SETWEEN AND

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            seq length: 0 seq length: 1000000

This is a partial sequence of human sperm specific antigen 4.1.

The sequence was deduced from a cDNA clone (see X06777) isolated from a human testicular cDNA library using marmoset 4.1 cDNA as probe. A full-length sequence for protein 4.1 is provided in W88380. Human and marmoset sperm protein 4.1 and 6.7 (see W88373-80) and nucleotide sequences (see X06772-79) encoding them are new. The proteins are sperm specific and can be used in a contraceptive vaccine to prevent or reduce fertility in a subject without the autoimmune reactions that are a serious side-effect of the sequence of the sequ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             W88378

This is a full-length sequence of human sperm specific antigen 4.1 The sequence was deduced from a cDNA clone (see X06777) isolated from a human testicular cDNA library using marmoset 4.1 cDNA as probe. Human and marmoset sperm proteins 4.1 and 6.7 (see W88373-80) and nucleotide sequences (see X06772-79) encoding them are new. The proteins are sperm specific and can be used in a contraceptive vaccine to prevent or reduce fertility in a subject without the autolamune reactions that are a serious side-effect of prior art female contraceptive vaccines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; Page 85-89; 129pp; English.

Probes derived from the EPH-related PTKS Cek4 (Q90659) and Ce (Q90660) were used to isolate novel CDNA clones (Q90652-58, Q90661-62) from chicken embryo and embryonic brain libraries. Cek4 is highly expressed in the chicken developing brain and embryonic tissues and also in the adult brain and retina. Sequence 983 AA;

Entire sequence from T4-encoding plasmid p170-2. It is almost identical to the sequence published by Maddon et al. (1985) with the exception of three codon changes. At T4 amino acid residue 3, (posn.403 of entire sequence) Lys is encoded in stead of Asn. At posn. 64, (posn.464) Arg replaces Trp and at posn. 231, (posn. 631) Ser replaces Phe.
                                                                              ARC and HIV infection.

Disclosure; fig 1; 100pp; English.

Disclosure differs from that determined by PJ Madden et al., [Cell, 42 pp. 93-104 (1985)] in three places due to three nucleotide substitutions. The Asp reported at position 3 by Madden et al. was the result of a sequencing error [DR Littman et al. Cell, 55, p.541 (1988)].

X = stop codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2268
       The sequence was deduced from the cDNA insert of p170-2. Soluble T4 constructs may be produced by truncating this sequence is fragments from position 400 to 799, removing the transmembrane and intracytoplasmic domains whilst retaining the extracellular region responsible for HIV binding. The sol. T4 is combined with an anti-
                                                                                                                                                                    Combinations of soluble T4 protein and anti-retroviral agent having symergistic activity in treatment and prevention of A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Soluble T4 can be produced by truncating the CDS to remove the transmembrane and cytoplasmic domains. The soluble forms may be modified to increase their immunogenicity by addition of an adjuvant such as incomplete Freund's adjuvant. The T4 interferes with HIV/T4 interaction and elicits anti-soluble T4 antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating or preventing AIDS, ARC or HIV infection administering an immunologically effective amt. of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             သူ
PT New compositions for immuno-therapy and protection - comprise PT nucleotide sequences encoding an immuno-modulating protein and an PT antigen, used for e.g. infections, cancer or auto-immune diseases PS Example 6; Fig 14; 136pp; English.

CT he present sequence represents the protein from the third reading CT frame of human immunomodulatory protein BL-1 encoding cDNA (given in CC v30915). The present invention describes a plasmid which comprises a cnucleotide sequence (NS) that encodes:(a) an immunomodulating protein Selected from interleukin (II)-12, granulocyte-macrophage colony CC stimulating factor (GM-CSF), IL-1), IL-15, IL-18, and BL-1 operably CC INF- beta, IL-2, IL-4, IL-5, IL-10, IL-15, IL-18 and BL-1 operably CC inked to induce an immune response to an antigen such as a pathogen can be used to induce an immune response to an antigen such as a pathogen colony can be used for immunotherapy or to provide a protective immune color response. In particular, they can be used for treating subjects with careful as cancer or psorlasis or autoimmune diseases or an allergen careful reaction, pathogen infection, hyperproliferative disease cancer or psorlasis or autoimmune diseases e.g. rheumatoid component diabetes mellitus, autoimmune thyroiditis, ankylosing color casculitis, Wegener's granulomatosis, Crohn's disease and ulcerative coloris, Grave's disease, autoimmune thyroiditis, askthma and colorisis of colorisis anadmane allocases and ulcerative colorisis of colorisis of sequence 242 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Fig 14A; 48pp; English.

This is the amino acid sequence of porcine interferon alpha-1, as deduced from the open reading frame of a cDNA clone (see V68167). The invention provides bovine, murine, porcine, feline, laprine and rat mature alpha, beta and gamma interferons and their propeptides (see W83895-905, W83918 and W70582-85). Recombinant DNA methods can be utilised to prepare these non-human animal interferons in amounts sufficient to enable the determination of their blochemical properties and bloactivities, and hence to allow efficient production for commercial or biological exploitation. Interferons are useful as antiviral and antitumour agents.
                                                                                                                                                                                                                                                                                                                                                                                      sus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (GETH ) GENENTECH INC.

expressing human cytochrome p450 and a yeast NADPH-P450 reductase

PS Examples; Page 23-25; 124pp; English.

CC cDNA was amplified by PCR using the primers 087735-8. The product was

CC cloned into the yeast expression vectors pAAH5N or pAHRR to produce the

CC vectors p2C9 for the expression of the cytochrome P450 alone or p2C9R

CC for co-expression with the yeast NADPH-P450 reductase.

CC The vectors are used in a method for evaluating the safety of a chemical

CC compound by reacting the chemical compound with recombinantly produced

CC human cytochrome P450 molecular species and variants (087716)

CC or 3A4 (087717), or their auxillary species and variants (087718-32), and

CC yeast NADPH-P450 reductase, either as a fused protein or in cell

CC extracts, and analysing the resulting metabolite to assess the safety of

CC the chemical compound. The method is useful for determining whether and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 6; Fig 14A; 59pp; English.

CC This is the amino acid sequence of porcine interferon alpha-1,

CC deduced from a cDNA (see V08184). The invention provides

CC bovine, porcine, feline and rabbit mature interferons and their

CC propeptides (see W73224-35). Recombinant DNA methods can be used

CC propare these non-human animal interferons in amounts sufficient

CC to enable the determination of their biochemical properties and

CC bioactivities, and hence to allow efficient production for

CC commercial or biological exploitation. Interferons are useful as

CC antiviral and antitumour agents. A replicable expression vehicle

CC comprising claimed non-human animal interferon nucleic acid, a

CC process for producing such an interferon, and a microorganism

CC (especially Escherichia coli) or cell culture transfected with the

CC nucleic acid are claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş

The present sequence is the human derived cytochrome (HDC) p4502c9, which was obtd. from a commercial cDNA library. Yeast were transfected with an expression vector contg. the HDC cDNA, cultured and then disrupted to give a microsomal fraction. The HDC was purified from the fraction, and used to immunise and sensitise a mammal. Blood was drawn from the mammal, and an anti-HDC antibody isolated. The antibody obtd. recognises HDC p4502c9, partic. at a serum dilution rate of 1:10000, and is substantially without cross reaction to other HDC p450 spp. . Sequence 490 AA;

This is the amino acid sequence of the human cytochrome P450 molecular Species 209 protein. The corresp. gene was amplified from a human liver derived cDNA library as 2 fragments of 0.9 and 0.6 kb using primers 725925-8. The prod. was cloned into the yeast expression vector PAAH5N to generate plasmid p209 for prodn. of the cytochrome only or into the vector pAHRR to generate the plasmid p209R for co-prodn. with the yeast vanney-p450 reductase. The sequence is placed under control of the yeast
Claim 6; pages 309-310; 989pp; English.

Claim 6; pages 309-310; 989pp; English.

The present sequence represents a Staphylococcus aureus protein of unknown function. The DNA sequence was isolated from a library of clones of S. aureus WCUH 29 in Escherichia coli. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the control of bacterial gene expression. The present protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ADH gene promoter and terminator.

ADH gene promoter and terminator.

The vectors are used in a method for evaluating the safety of a cpd. by reacting the test cpd. with recombinantly produced human cytochrome P450 mol. species 1A2 (T28380), 2C9, 2E1 (T28382), 3A4 (T28383) or their mol. species 1A2 (T28380), 2C9, 2E1 (T28382), 3A4 (T28384-98) together with yeast NADPH-P450 reductase (either as variants (T28384-98) together with yeast NADPH-P450 reductase (either as

This protein comprises a novel human metabotropic glutamate receptor, designated mGluR8. Its amino acid sequence was deduced from cDNA clones isolated from a human foetal retina cDNA library.

The metabotropic glutamate receptors are linked to mutiple second messenger pathways. They function to modulate the presynaptic release of glutamate, and the postsynaptic sensitivity of the neuronal cell to glutamate excitation. Host cells transfected with an expression vector comprising nucleic acids encoding mGluR8, are claimed. They can be used in claimed methods for evaluating the effectiveness of a test compound for the treatment or prevention of a condition associated with a deficiency or excess of stimulation of the human mGluR8 receptor. mGluR8 agonists and antagonists can be used to treat neurodegenerative diseases, or as antipsychotic, antiemetic agents.

RC TISUE-NEURAL CREST;

RX MEDLINE, 95001564.

RA WINNING R.S., SARGENT T.D.;

RY TABSEL COLOR AND ACT THE EPH family of receptor tyrosine kinase genes, has localized expression in a subset of neural crest and neural rissues in Xenopus laevis embryos.";

RI Lissues in Xenopus laevis embryos.";

RC -1- FUNCTION: RECEPTOR FOR MEMBERS OF THE EPHRIN-A FAMILY (BY SIMILARITY). MAY PLAY A ROLE IN THE DIFFERENTIATION OF CRANIAL COMMENTAL CREST AND OTHER TISSUES.

C -1- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP + PROTEIN TYROSINE PHOSPHATE.

CC -1- CATALYTIC ACTIVITY: LOCALIZED EXPRESSION IN A SUBSET OF NEURAL COLORITORY: LOCALIZED EXPRESSION IN A SUBSET OF NEURAL COLORITORY: COLORITOR TRANSLENTLY IN VISCERAL ARCH 3. ALSO CENTRESSES IN THE FOREBRAIN, RHOMBOMERES R3 AND R5 OF THE HINDBRAIN C-1- SIMILARITY: CONTAINS 1 INMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.

CC -1- SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC CREST. ALBACAL 1.-

                                                                                                                                                                                                                                                                                                                                                                                             SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

TISSUE SPECIFICITY: WITHIN THE NERVOUS SYSTEM, EXPRESSION IS
RESTRICTED TO PROSOMERES 1 AND 2 IN THE DIENCEPHALON AND ALL THE
RHOMEOMERES IN THE HINDBRAIN DURING SEGMENTATION STAGES. LATER ON,
A SUPERIMPOSED PATTERN APPEARS THAT CORRELATES WITH THE FORMATION
OF SEVERAL AXONAL TRACTS. IN THE SOUTHIC MESODERM, THE EXPRESSION
CORRELATES WITH SEGMENTATION AND THE GUIDANCE OF BOTH NEURAL CREST
AND MOTOR AXONS THROUGH THE SCLEROTOMES.
SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALLYTIC
DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.
SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAIN.
SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TYROSINE PHOSPHATE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      54
                                                                          DEVELULIAR LOCATION: TYPE I MEMBRANE PROTEIN.

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

DEVELOPMENTAL STAGE: MATERNALLY EXPRESSED, IT DECREASES AT MID DEVELOPMENTAL STAGE: MATERIOR AND LATE NEURULATION. EXPRESSED AT HIGHER LEVELS IN THE ANTERIOR AND DORSAL REGIONS OF EMBRYONIC STACES 16, 24 AND 37. IN ADULT IT APPEARS TO BE UBIQUITOUSLY EXPRESSED WITH HIGHER EXPRESSION IN BRAIN AND OVARY. EXPRESSION I THE BRAIN, BRACHIAL ARCHES, TRIGEMINAL FACIAL GANGLION, AND THE EMPAIN OF SWIMMING TADPOLE STAGE OF DEVELOPMENT.

SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC DOMAIN. BELONGS TO THE EMPHRIN RECEPTOR FAMILY.

SIMILARITY: CONTAINS 1 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.

SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EISGVDEHYTPIRTYQVCNVMDHSQNNWLRTNWVPRNSAQKIYVELKFTLRDCNSIPLVL

                                                                                                                                                                                                                                                                                                                SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
TISSUE SPECIFICITY: EXCRESSED IN THE EMBRYO II PRE-SOMITIC
MESODERM, CAUDAL SOMITES, MIDBRAIN, AND CEMENT GLAND. MOST
ABUNDANT IN ADULT BRAIN, EYE, HEART, LUNG AND OVARY. LOWER
IN INTESTINE, KIDNEY, OVIDUCT AND PHARYNX.
DEVELOPMENTAL STAGE: EXPRESSED DURING EARLY DEVELOPMENT.
SIMILARITY: TO OTHER PROTEIN TYROSINE KIALY DEVELOPMENT.
SIMILARITY: CONTAINS 1 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.
SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
